Book Descriptions:

Crossover Dbx 234 Manual

The 234xs uses precision filters to separate the audio signal and direct the correct frequencies to your loudspeaker drivers. By directing only the specific frequency bands to each speaker driver the 234xs leaves your amplifiers free to use their full power on the usable signal eliminating distortion and giving your PA system a cleaner and better sound. It features LinkwitzRiley 24dB per octave filters, independent output gain controls for level matching, output phase inversion, 40 Hz low cut filter, and optional mono summing of the low frequency subwoofer output. This mono subwoofer feed may be a mono powered subwoofer, multiple mono powered subs paralleled daisy chained together, a bridged amplifier with two subwoofers paralleled together or could even be multiple bridged amps paralleled together. Basically, whenever using a stereo FOH system where there is only one subwoofer feed needed. Each output has its own polarity inversion switch. These should only be pressed in if the speaker manufacture recommends it or you have a polarity problem somewhere in your signal chain. Polarity inversion is a 180 degree phase shift. Having some of the speaker drivers out of polarity can cause the system to sound hollow, appear to be lacking in the lower frequencies or sound very phasey. These switches can come in handy when you are in a pinch, ready to start the show and notice a polarity problem. With these switches, you can quickly get the system back in phase and be ready to go on with the show. Also, when you open the box, you wont find the external power supply that accompanies most processors in this price range. Thats because we know how difficult external powersupplies can be to work with and even though it costs a little more we put the high quality power supply right in the unit. All the inputs and outputs are XLR balanced jacks that are bolted down to the chassis. Another back panel switch also selects whether or not you want to mono sum the LF subwoofer out. <http://amorbj.com/upload/file/2020/11/182104052601.xml>

Most systems that use a subwoofer are mono subbed to take advantage of amplifier power and because low frequencies are nondirectional. Back panel switches allow you to select the range of the crossover frequencies individually for both channels. The crossover frequency controls have a green LED that indicates the X10 switch on the back panel is activated we wouldnt make you check the switch position on the back every time you wonder where its set. All these switches are on the back panel because it could be disastrous if you were to change them midprogram. On the front panel youll notice there are LEDs that indicate whether the unit is in mono or stereo mode. Each channel has an input gain control for proper level setting. Theres a recessed 40 Hz low cut HPF on each channel to remove unwanted low frequencies. Also, these outputs each have phase reverse switches thatll help get you out of a bind without having to reconfigure your system. These phase reverse switches may be internally reconfigured as mute switches. A crossover is essential for efficient PA operation because it filters the full band input signal into specific frequencies that match a speakers optimum frequencyreproduction range. This leaves the amplifier free to use its full power on the usable signal, eliminating distortion and delivering clear sound. The controls exude great precision, and the feel is a solid "click." Also, when you open the box, you won't find the external power supply that accompanies most processors in this price range. That's because dbx knows how difficult external power supplies can be to work with and even though it costs a little more they put the high quality power supply right in the unit. This "nutting down" of the jacks insures that even if someone steps on a cable plugged into the unit, it's not going to tear up the circuit board inside. All dbx crossovers feature LinkwitzRiley 24 dB per octave filters, the professional standard, but then again, what did you expect Another back panel switch also selects whether or not you want to mono sum the LF subwoofer out.
